

ALEX® IgE-Allergen Screening of 282 Allergens

ALEX® IgE allergen profile

The detection of allergen-specific IgE antibodies in serum plays a crucial role for the diagnosis of type 1 allergies.

For patients with multiple allergen sensitizations or for patients with ambiguous clinical symptoms the conventional determination of individual allergens is often an expansive and lengthy procedure.

In cases like these, a **comprehensive allergen screening** provides a clear picture of the patient's sensitization profile and thus serves as a powerful tool for the correct diagnosis and prevention of allergen exposure.

The **ALEX® Allergy Explorer** allows the **simultaneous measurement** for the total IgE and **specific IgE against nearly 300 allergens**, among those 120 extracts and up to 180 allergen components. The test thus covers **99 % of all possible type 1 allergen sources** and requires a mere 1 ml of blood.

The method

ALEX® Allergy Explorer is a quantitative solid phase immunoassay. Specific IgE antibodies from the patient's serum bind to the allergens (extracts and/or components) on the macroarray. Adding a CCD-inhibitor reduces unspecific reactions and thus increases the test's specificity. Colorimetric analysis is used to detect bound IgE antibodies. Test results for allergen-specific IgE are reported quantitatively in kUA/l (Fig. 1).

Fig. 1 Colorimetric spots on the biochip indicate the reaction of allergen and IgE antibodies. The signals' intensity is proportional to the amount of specific IgE antibodies bound to the allergen.

ALEX® IgE allergen profile's advantages compared to specific IgE diagnostics and prick test:

- Preparation of a complete sensitisation profiles for patients with suspected manifold allergies or in cases with ambiguous anamnesis.
- Differentiation between real sensitisation and cross-reactivity in order to better assess the danger of anaphylactic reactions for suitable therapy planning.
- In patients with multiple-allergies comprehensive analysis regarding the individual sensitisation pattern, allowing detailed nutrition counselling.
- In order to dismiss allergy as the cause of patients' symptoms.

Material

1 ml serum (whole blood)

Request: **ALEX IgE allergen profile**

Invoicing

Costs for the complete profile are 262.30 €.

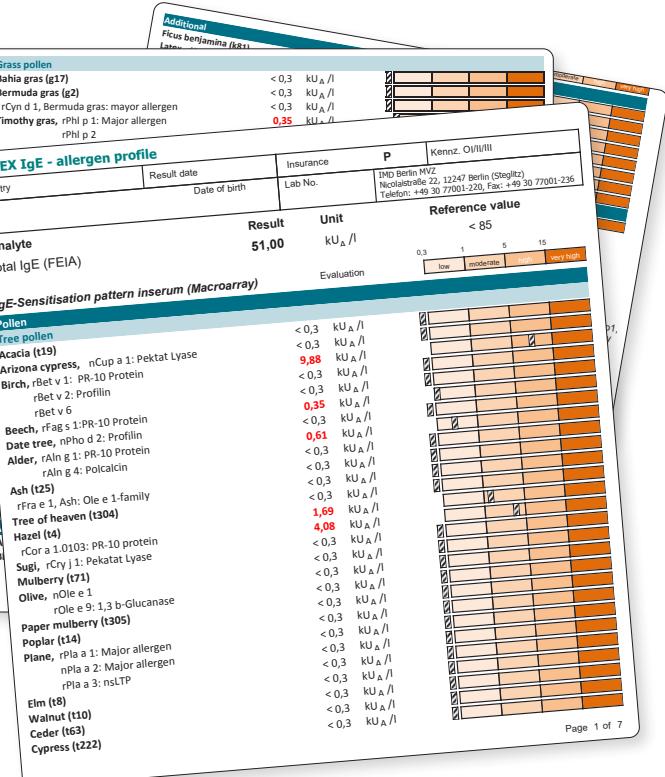

Fig. 2 We deliver the test results along with a detailed commented report including information on specificity and cross-reactivity of positive allergen components.

INFORMATION REGARDING THE MOST IMPORTANT ALLERGEN FAMILIES

Paralbumins ¹¹

- Proteins that are stable to heat and digestion, characteristics of air-born pollutants and thus both food and inhalation allergen
- Cross-reactive, pan-allergen in fish

Tropomyosins ¹²

- Proteins with high allergenic potential that are stable to heat and digestion
- Cross-reactive, pan-allergen in seafood, mites, cockroaches, and parasites

Cross-reactive Carbohydrate Determinants (CCD) ¹³

- Sensitisation marker regarding carbohydrate determinants
- Cross-reactive, included in pollen allergens, vegetarian foods and insect (venom)
- Low clinical relevance
